INTERNATIONAL PRELIMINARY EXAMINATION REPORT

International application No.

PCT/DK 02/00461

see separate sheet

INTERNATIONAL PRELIMINARY International application No. PCT/DK 02/00461 EXAMINATION REPORT - SEPARATE SHEET

Re Item IV Lack of unity of invention

This Authority considers that there are 2 inventions covered by the claims indicated as follows:

I: Claims 1-20, 28-32 directed to: compressed chewing gum tablet

II: Claims 21-27, 33 directed to: chewing gum granulate

The reasons for which the inventions are not so linked as to form a single general inventive concept, as required by Rule 13.1 PCT, are as follows:

The subject-matter of independent claim 1 is directed to a compressed tablet comprising gum base granules and additives in a gum center.

The subject-matter of independent claim 21 is directed to chewing gum granulate (not even related to the gum base) comprising a specific amount of a resin.

Thus, there exists no technical relationship between both subject-matter which links them to form a single general inventive concept.

Re Item V

Reasoned statement with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

Reference is made to the following documents:

D1: EP-A-0 151 344 (WARNER LAMBERT CO) 14 August 1985 (1985-08-14)

D2: US-A-5 017 385 (WIENECKE HORST P) 21 May 1991 (1991-05-21)

D3: US-A-4 737 366 (GERGELY GERHARD ET AL) 12 April 1988 (1988-04-12)

Novelty:

The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claim 1, 21 and 28 is not new in the sense of Article 33(2) PCT.

The document D1 discloses a compressed chewing gum tablet, chewing gum granulation and a method of providing a compressed chewing gum as claimed in

present claims 1, 21 and 28 (See in particular claims 1, 12, 20, p. 10, l. 32 to p. 11, l. 25 in D1). According to present claim 1, the gum center can be partly encapsulated by a lubricant, a glidant or an anti-adherent. A lubricant, a glidant or an anti-adherent is also used as a compression aid in D1 (see claim1). Thus, as such a barrier layer as presently claimed is also formed in D1. As far as the present granulates are concerned, it should be stated that it is claimed that they are "substantially free" of lubricants, glidants or anti-adherents. This means that small amounts of them can be present in the granulates as it is the case in D1 (see e.g. the examples in D1).

Also the content of D3 is novelty destroying for the subject-matter of claim 1 (See in particular examples 1 and 2 in D3). D3 relates to a chewing gum consisting of a granulated chewing gum base and fillers, additives and active substances. Furthermore, the chewing gum there comprises a tablet coating. Sugar which is used as a coating aid in the example in D3 can be considered as glidant.

Inventive step:

The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claims 1, 21 and 28 does not seem to involve an inventive step in the sense of Article 33(3) PCT.

The object of the present invention is to provide a compressed chewing gum tablet which provides a texture like conventionally mixed chewing gum. In the light of present examples on pages 30 and 31 the desired texture characteristics have been achieved by adding natural resins to the compositions.

The document D1 is regarded as being the closest prior art to the subject-matter of claims 1, 21 and 28. Said document also discloses the presence of natural resins (see in particular pages 10 and 1, claims 1, 12, 16 and 20) in the preparation of compressed chewing gum tablets. Accordingly, the presently posed problem has already been solved in a similar manner by D1.

Furthermore, as far as the wording of claim 1 is concerned, it should be stated that said wording does not explicitly claim a tablet which comprises natural resins.

The applicant states that the present chewing gum tablet has an improved texture and that the chewing gum of D1 has relatively poor texture and tackiness compared to conventionally mixed chewing gum. The present application does not provide any evidence (e.g. comparative examples) which demonstrates these statements. As far as a "barrier layer" in the present tablets is concerned, it should be stated that when considering a partly encapsulation by a barrier layer selected from the group of lubricants (as claimed in present claim 1), such an encapsulation with a lubricant (e.g.

INTERNATIONAL PRELIMINARY International application No. PCT/DK 02/00461 EXAMINATION REPORT - SEPARATE SHEET

hydrogenated cottonseed oil as also used in the examples of D1) can not be considered to be a real, hard encapsulation of the tablet. It is only an oil barrier which forms a part of the gum composition due to the physical characteristics of an oil. Thus, the presently posed problem has already been solved by the compressed chewing gum of D1.

Remaining dependent claims:

Dependent claims are only allowable when related to an allowable independent claim.
